SERVICE PROCEDURES

1. REPLACING THE AC FUSE

Universal Model

This model is equipped with a universal power transformer to permit operation at either power source of 110, 120, 220 or 240V AC 50/60Hz.

To convert the unit to a different power source voltage, change the plug as illustrated in the drawing below.

CAUTIONS: 1. For continued protection against fire hazard, replace only with same type and same rating fuse.

110/120V model 1A-T (Parts No. 252001)

220/240V model 0.5A-T (Parts No. 252023)

2. Disconnect power supply cord from AC outlet before converting voltage.

2. REPLACING THE HOLDER OF INDICATOR

1. Remove the two screws holding the top cover and back panel.
2. Remove the four screws holding the top cover and side brackets.
3. Pull out the output level knob.
4. Remove the five screws holding the front panel and front bracket.
5. Disconnect the holder of indicator by pressing against the nails of holder from front side.

3. DE-EMPHASIS SWITCH

The 25 μ sec/Normal selector switch for Dolby FM broadcasts is located on the front panel. The 50 μ sec/75 μ sec selector switch employed in the Universal Type is located on the bottom board. When shipped from the factory, this bottom board switch is set to the 50 μ sec position. For use in 75 μ sec regions, switch over to the 75 μ sec position.

4. SENSOR SWITCH

For matching the automatic FM tuning servo locked system to the various operating conditions. Set to LOW initially and switch to NORMAL or HIGH if the TUNED lamp does not turn off as soon as the tuning knob is touched.

STRINGING DIAGRAM

1. Close the variable capacitor complete and tie the dial cord to the spring of the drum.
2. Thread the dial cord in the direction of arrow from (1) to (3) and wind the dial cord three turns around the tuning shaft clockwise.
3. Wind the dial cord 1½ turns around the dial drum.
4. Thread the dial cord to the dial pulley 3.

PACKING PROCEDURES

120V model

1. All printed material and accessory items are placed in the poly bag.
2. The sensor tag is attached to the output level volume shaft.

CIRCUIT DESCRIPTION

1. QUARTZ LOCKED CIRCUIT

The quartz locked circuit compares the frequency difference between the 10.7MHz reference signal and the IF signal, the difference being used to subsequently drive the AFC circuit.

A 10.7MHz component is extracted from the quadrature detector output by the L104 and C117 trap, amplified by the Q103 IC, and applied to pin no. 5 of the Q105 IC. An accurate 10.7MHz reference signal is generated by the quartz oscillator, and applied to pin no. 1 of the same IC. A 19kHz square wave is obtained from pin no. 10 of the PLL IC, and applied to pin no. 3 of Q105. The IF signal and the quartz oscillator reference signal are switched back and forth in a 19kHz cycle, and passed on to the detector and amplification stages. When S1 and S2 are both connected to the IF signal line, the IF frequency is detected, resulting in the generation of a voltage whose level corresponds to the IF frequency. This voltage is then applied to one of the differential amplifier inputs. When S1 and S2 are then both switched across to the quartz oscillator signal line, the quartz oscillator reference signal is detected, converted into the corresponding voltage, and applied to the other input of the differential amplifier. The difference between the IF detector DC component and quartz oscillator detector component is then amplified, appearing at pin no. 14 of the IC. This voltage serves as the AFC circuit control voltage. Any slight drift or deviation in the detector transformer will therefore result in the same amount of drift in both lines, thereby maintaining a constant difference. Precise local oscillator frequency will thus be kept at all times.

2. AFC SWITCHING CIRCUIT

In order to ensure accurate tuning, the AFC circuit is turned off automatically once the tuning knob is touched, and also when the muting circuit is switched off.

When a station is tuned, Q808 will turn off and Q809 turn on (since Q805 will already be off and Q806 on), resulting in the LOCKED lamp turning on. And since Q815 will turn off when Q809 turns on, the AFC circuit will also begin to operate.

When the tuning knob is touched, a certain amount of hum is induced. This hum is amplified by Q801, rectified (full-wave) by D817 and D818 into a DC signal, and applied to Q808 is consequently turned on, resulting in the AFC circuit being switched off. If, however, the hum level is rather low, the LOCKED lamp might not turn on even when the tuning knob is touched. If this happens, reset the rear panel sensor switch to either the Normal or High positions.

3. SIGNAL INDICATOR DRIVER CIRCUIT

The signal indicator driver circuit is activated by the detector of three or two point. Three point detector is used the Universal model and two point detector is used the 120V model. Q702 is the signal strength indicator driver IC. The IF signal is rectified by the IF level detector circuits and changed the DC component. The DC component applied to pin no. 2 and no. 3 of Q702 is amplified. The signal strength indicator LEDs connected to the IC output terminals pin nos. 9–13 are lit up in succession depending on the input level.

ALIGNMENT PROCEDURES

(5). QUARTZ LOCKED CIRCUIT ADJUSTMENT

1. Connect the signal generator to the 300ohm antenna terminals and the DC voltmeter to the detector output (pin nos. 10)
2. Set the SG output to 98MHz, 1kHz 75kHz devi., 65dBf (60dB).
3. Turn the tuner to 98MHz.
4. Adjust the voltage to 3.5V with a detector coil of L106.
5. Then connect the DC voltmeter to the AFC output terminal of TP-5.
6. Place the short circuit across TP-4 (pin nos. 10 and 11).
7. Adjust the semi-fixed resistor of R137 to bring the AFC output voltage to zero.
8. Remove the short circuit across TP-4.
9. Adjust the semi-fixed resistor of R130 to bring the AFC output voltage to zero.

(6). RECORDING CHECK LEVEL ADJUSTMENT

1. Connect the signal generator to the 300 ohm antenna terminals and the AC voltmeter to the output terminals.
2. Set the SG output to 98MHz, 400 Hz 75kHz devi., 65dBf (60dB).
3. Turn the tuner to 98MHz.
4. Adjust the output level control to bring the output level to 300mV.
5. Push the RECORDING CHECK switch to ON.
6. Adjust the semi-fixed resistor of R251 to bring the output voltage to 150mV.

(7). SIGNAL STRENGTH INDICATOR ADJUSTMENT

1. Connect the signal generator to the 300ohm antenna terminals.
2. Set the SG output to 98MHz, 1kHz 75kHz devi. 65dBf (60 dB).
3. Turn the tuner to 98MHz.
4. Adjust the semi-fixed resistor of R705 to light up the 5th L. E.D.

NOTE: Only Universal model.
